Abstract	iii
Zusammenfassung	v
Acknowledgement	xv
1 Introduction	1
1.1 Wireless sensor networks for structural health monitoring	1
1.2 Challenges in AE detection for environmental monitoring and project goal	1
1.3 Thesis objective	3
1.4 Outline	3
2 State of the Art	5
2.1 Acoustic emission sensing for structural health monitoring	5
2.2 Sensor calibration and applications	6
2.3 Low power acoustic emission monitoring systems	7
2.4 AE sensors	8
2.4.1 Piezoelectric AE sensors	8
2.4.2 Capacitive MEMS	9
2.4.3 Piezoelectric MEMS	10
2.5 Other related work	10
2.5.1 Inertial switches	10
2.5.2 Micromechanical amplifiers	11
2.5.3 Modeling and analysis of microelectromechanical pull-in switches	11
2.5.4 Pull-in based sensors	12
2.6 Summary state of the art	12
3 System Architecture and Lumped Element Model	15
3.1 Overview: Transducer concept	15
3.1.1 Input signal	15
3.1.2 Mechanical amplification	18
3.1.3 Electrical signal transduction: Pull-in contact switch	18

Contents

3.2	The one dimensional pull-in vibration switch in the parallel plate approximation	20
3.2.1	Spring softening and compensation strategy for dynamic operation	23
3.3	Numerical methods for solving the forced nonlinear EoM	25
3.4	Dynamic pull-in: Single resonator system under harmonic excitation	26
3.5	The n -coupled resonators amplifier with applied bias voltage . . .	27
3.5.1	Mechanical amplification concept	27
3.5.2	Lumped element model of the biased coupled-resonator mechanical amplifier	28
3.5.3	Small amplitude and voltage approximation	30
3.5.4	Capacitive readout	31
3.6	Small amplitude approximation and compensation strategy	32
3.6.1	Static pull-in of a coupled resonators amplifier	32
3.6.2	Spring softening compensation applied to a coupled resonators amplifier	33
3.6.3	Frequency tuning and linearized transfer function of a coupled resonators amplifier	34
3.7	Dynamic pull-in of the n -coupled resonators pull-in vibration switch	37
3.8	Summary	39
4	Design for Fabrication in Planar Technology	41
4.1	Technology: State of the art	41
4.2	Design goals and constraints	43
4.3	Design guidelines for the mechanical amplifier in planar technology	46
4.4	Mechanical amplifier with differential capacitance (6MA design) .	49
4.4.1	Design freeze	49
4.4.2	Capacitive geometry	52
4.4.3	Summary	54
4.5	Three-coupled resonators amplifier combined with pull-in trigger (3M design)	54
4.5.1	Design modifications for triggered operation	54
4.5.2	Lumped parameters	56
4.5.3	Process specific design rules (<i>epi-seal</i>)	56
4.5.4	Single resonator pull-in vibration trigger (1M design)	57
4.6	Summary design	58
5	Fabrication and Model Parameter Extraction	59
5.1	Silicon on insulator (SOI) based micromachining (6MA design) . .	59
5.1.1	Yield	60

5.2	Influence of process variation on the transfer function and mode shapes	61
5.2.1	Geometric shape variation	61
5.2.2	Stress induced spring stiffening	61
5.2.3	Summary	65
5.3	Epitaxially sealed near-vacuum wafer-level packaged devices (<i>epi-seal</i>)	65
5.3.1	Motivation for Si-Si contact switches fabricated in the <i>epi-seal</i> process	66
5.3.2	Fabrication results and yield	67
5.3.3	Discussion	69
5.3.4	Summary epitaxially sealed devices	70
6	Methods: Dynamic Characterization	71
6.1	Optical and differential capacitive characterization of the mechanical amplifier (6MA)	71
6.1.1	Optical measurement of unpackaged devices	72
6.1.2	Capacitive characterization of packaged devices	72
6.2	Characterization of vibration switches (1M and 3M)	74
6.2.1	Pull-in voltage measurement by frequency detuning	74
6.2.2	Cycled trigger characterization	75
6.3	Determination of damping matrices	78
6.3.1	Damping coefficient model of the mechanical amplifier with differential capacitance (6MA)	78
6.3.2	Damping coefficient of encapsulated switches (1M and 3M)	79
6.4	Summary	80
7	Proof of Concept: Mechanical Amplifier with Differential Capacitance	81
7.1	Optical measurement of mode separation	81
7.2	Capacitive measurement	82
7.3	Damping and pressure dependence	84
7.3.1	Experimental pressure dependent transfer function	84
7.3.2	Lumped element model	85
7.4	Discussion	88
7.4.1	Performance as mechanical filter	88
7.4.2	Response time and quality factors	89
7.4.3	Damping model	89
7.4.4	Axis selectivity	90
7.4.5	Influence on process variation on device performance	91
7.4.6	Electrostatic force feedback	91
7.5	Conclusion	91

8	Proof of Concept: A Pull-in Switch for Bandpass Vibration Detection	93
8.1	A single resonator pull-in trigger (1M)	93
8.1.1	Frequency tuning and pull-in voltage extraction	93
8.1.2	Frequency and amplitude dependent regions of stability	94
8.1.3	Simulated regions of stability	95
8.1.4	Experimental instability bands	95
8.1.5	Time traces	97
8.1.6	Discussion	101
8.1.7	Conclusion	105
8.2	Pull-in of mechanical amplifier (3M)	105
8.2.1	Frequency tuning and pull-in voltage extraction	105
8.2.2	Simulated regions of stability	107
8.2.3	Experimental instability bands	108
8.2.4	Comparison between lumped model and experimental data	108
8.2.5	Experimental time to trigger	112
8.2.6	Discussion	112
8.2.7	Conclusion	115
8.3	Conclusion	115
9	Discussion and Outlook	117
9.1	Electrical readout: Linear vs. triggered operation	117
9.1.1	Mechanical transfer function	117
9.1.2	Damping	118
9.1.3	On-off ratio and power consumption	119
9.2	The influence of noise on the trigger characteristics	121
9.3	Applicability to transient burst signals	121
9.4	Parameter dependence of system performance	123
9.4.1	Definition of broadband threshold and bandwidth	124
9.4.2	Operation setpoint proximity to instability	124
9.4.3	Gap-scaling	125
9.4.4	Scaling in dependence of mechanical amplifier structure	126
9.5	Outlook	127
10	Concluding Remarks	129
11	Appendix	131
11.1	Parallel plate approximation of differential capacitance	131
11.2	Process runsheet	132
11.3	Sample pre-characterization and yield	133
11.4	Capacitance to digital conversion	134

11.5 Amplitude effect of the non-linear differential capacitance component on spectral measurements	135
11.6 Supporting information on Chap. 8	136
